

Amit Kumar C JAIN

A 30-year-old man presented with history of pain abdomen, vomiting, fever and loose motion for two days. The pain was located in the right lower quadrant of the abdomen. General examination showed his pulse rate to be 94 per minute and blood pressure was 130/72 mmHg. Abdominal examination revealed tenderness in the right iliac fossa along with rebound tenderness. A clinical diagnosis of acute appendicitis was made and patient was subjected to an open appendicectomy. During surgery, patient was found to have an inflamed, gangrenous appendix which was removed. While demonstrating our undergraduate students, we unexpectedly found an interesting finding (**Panel** indicated by arrow).

What is the diagnosis?

Answer: refer to page 171
