

**SM Rabiul ISLAM and Ketan PANDE**

A 5-year-old girl was seen in the fracture clinic for management of left ankle injury sustained a week earlier. Plain radiographs of the left ankle (**Panel**) did not reveal any bony injury but a radiographic finding prompted the inquiry to the parents if the child had suffered from any major illness about 2-3 years back. The parents confirmed that the child had seizures and was hospitalised for a few weeks at the age of three years for investigations and management.

**What is the diagnosis?**

**Answer:** refer to page 48
